Abstract:

Background: Increased fluoride content in drinking water is a major source of dental fluorosis. It is considered to be the most common public health problem. It is found that dental fluorosis is more prevalent in southern parts of India mainly in Tamil Nadu.

Aim: To assess the prevalence of dental fluorosis in different districts of Tamil Nadu.

Methodology: A systematic review analysis was performed using pubmed, science direct, Wiley online library, OSF Healthcare, research gate, scopus using key words dental fluorosis and Tamil Nadu.

Result: Total of 443 articles appeared from various sources, all articles were screened and 8 were related to this study. This review was based on PRISMA guidelines.

Conclusion: In the available articles, Kanchipuram, Namakkal, Salem, Dharmapuri, Rameswaram are the districts show highest prevalence of dental fluorosis in Tamil Nadu.

Keywords: Dental fluorosis, Prevalence, Tamil Nadu

INTRODUCTION:

Excessive fluoride content in Drinking water contributes to the prevalence of Dental Fluorosis. It is a common Public Health problem in endemic areas of India. It is found that it is more prevalent in various districts of Tamil Nadu.

Dental fluorosis occurs when excessive fluoridated water is ingested during the years of calcification and usage of fluoridated toothpaste before the age of 2 years also contributes to this condition.

About 62 million people in India suffer from fluorosis, out of these 80% of the people are affected by dental fluorosis. Tamil Nadu is one of the 18 states affected by fluorosis in India. Dentifluorosis is characterized by hypo mineralization of tooth enamel. This hypo mineralization is mainly due to in situ toxic effects of fluoride on the ameloblasts of the enamel formation, and not caused by the general effects of fluoride on the calcium metabolism.

Dental fluorosis is a condition which can easily detected clinically. It is characterized by mottling of enamel, change of colour from yellow to brown to black. In moderate to severe forms tooth may get physically damaged. The clinical findings depends on the degree of dental fluorosis. People with fluorosis are relatively resistant to dental caries.

Dental fluorosis is endemic in some areas of Tamil Nadu but it is also found that it is also encountered in non-endemic areas like Kanchipuram.

OBJECTIVE:

To assess the prevalence of Dental fluorosis in various districts of Tamil Nadu

METHODOLOGY:

Inclusion Criteria:

• Original research articles
• Full text articles
• The articles emphasizing on the disease prevalence in Tamil Nadu.

Exclusion Criteria:

• Systemic review articles
• Articles stating about other forms of fluorosis
• Repeated study in the same area

Search Strategy:

Published articles related to dental fluorosis in Tamil Nadu which includes original articles and research papers in
Databases such as PubMed, Science direct, research gate, Wiley online library, OSF etc were taken into study for review. The search was based on the keywords Dental fluorosis and Tamil Nadu. A total of 443 articles appeared with this combination. Out of these, 8 articles were research related. After complete analysis, 8 articles were taken into consideration and were retrieved for review.

**Search engine:**
- Cochrane
- Pub Med
- Ovid Medline
- Science direct
- Wiley Online library
- Scopus
- OSF Healthcare
- Research gate

The search showed 438 articles and full text articles were independently assessed. Among these, 6 articles were included for review. Figure 1 shows the flow chart of the reports that were identified, duplicates removed, screened, excluded, assessed for eligibility and included in the systematic review.

**Figure 1: Records identified through electronic database searching**

- PubMed (n=5)
- Wiley online library (n=11)
- Science direct (n=34)
- OSF (n=388)
- Research gate (n=1)
- Scopus (n=0)

Other sources (n=4)

Records after duplicates removed (n=443)

Records screened (n=443)

Study excluded (n=435)

Study taken for review (n=8)
## RESULTS:

**DISCUSSION:**

Dental fluorosis is prevalent in many districts of Tamil Nadu, where most people among the population is exposed to high fluoride in drinking water which had manifestations of the teeth like motting of enamel, discoloration etc. Methodology and results of each study was tabulated. Based on that, V.C Punitha et al.[4] conducted a cross sectional study conducted in Kanchipuram, 345 children of age group were examined for fluorosis using dean’s index. The prevalence of fluorosis in this population was 67 out of 348 out of which around 20 children (29.8%) were in grade I, 10 children (14.9%) in grade II and 11 children (16.4%) in grade III and 26 children (38.8%) in grade IV and none in grade V.

V. Sivashankar et.al.[5] conducted a study in Rameswaram among 12 schools with 2519 girls and 2519 boys of age group 7 to 13 years. It is found that areas which contain highest fluoride content in water shows highest prevalence of dental fluorosis.

Dr. Prabhu et.al.[6] conducted a cross sectional study conducted in Kanchipuram district among 220, 12 year old children. 60.6% individuals of the study population was affected by dental fluorosis.

Maya Ramesh et.al.[7] conducted a pilot study in a private school in salem. This study was conducted for 965 children. Dental fluorosis was present in 31.1% of boys and 30.3% of girls 297 students out of 965(30.8%)showed the presence of dental fluorosis.

G. Ganesh et.al.[8] conducted a study for 2000 children in endemic areas of tamilnadu like dharmapuri, salem and krishnagiri districts. In group I among 750 individuals with dental fluorosis, 203 have dental caries. In group II among 780 individuals with dental fluorosis, 244 have dental caries. In group III among 750 individuals with dental fluorosis, 203 have dental caries.

Maya Ramesh et.al.[9] conducted a study for 206 patients who reported to the haematology department. Dental fluorosis was present in 63.1%

Baskaradoss J.K et.al.[10] conducted a Kanyakumari, a total of 1800 children was examined for fluorosis. The prevalence of dental fluorosis was higher in children who consumed pipe water compared to children who consumed ground water. 15.8% of the study population was affected by dental fluorosis.

S. Saravanan et.al.[11] conducted a study included children studying in 6 primary schools in the field practice area of rural health centre of faculty of medicine, Annamalai university at Chidambaram. The prevalence of dental fluorosis was 31.4%.

Dental fluorosis is a major health problem in India[12] north and southern parts of India are affected, in tamil nadu there are certain endemic states like Salem, Dharmapuri, Krishnagiri are affected the most. Non endemic states like Kanchipuram also shows prevalence of dental fluorosis.

Fluorosis is a cosmetic condition that affects the teeth, if it is mild no treatment is required. In severe cases there are many techniques like tooth whitening/bleaching, micro/macro abrasion, veneers, crowns, compound restorations.[13]

**CONCLUSION:**

Based on the available literature, fluorosis levels are higher in Kanchipuram, Namakkal, Salem, Dharmapuri, Rameswaran. These districts show highest prevalence of dental fluorosis in Tamil Nadu. This problem needs to be addressed.
